

Average Grade Calculator

User Guide | QuickerGrade

What it does

The Average Grade Calculator blends your grades into one true average. Enter each grade and its weight, and it shows your average plus its letter grade - and tells you what you still need on the remaining weight to reach a target average. It is free, needs no signup, and runs entirely in your browser.

How to use it

- **1. Enter a grade.** Type each score as a percentage (0-100) in a Grade % box.
- **2. Enter its weight.** Type how much it counts in the Weight % box. Weights do not need to total 100.
- **3. Add or remove rows.** Click + Add Grade for more graded items. Click the x button to remove a row.
- **4. Read your result.** Your average and letter grade update live as you type.
- **5. Set a target (optional).** Type a Target average to see exactly what you need on the remaining weight.

Formula

$$\text{Average} = (\text{Grade1} \times \text{Weight1} + \text{Grade2} \times \text{Weight2} + \dots) / \text{Total Weight}$$

Worked example

Grades: 90% with weight 20, and 80% with weight 30.

Average = $(90 \times 20 + 80 \times 30) / 50 = 4,200 / 50 = 84.00\%$ -> Grade B.

With a Target of 90%, you need an average of 96.00% on the remaining 50.00% of weight.

Target planner

Type a Target average to find out what you must score on the remaining weight. If the target needs more than a perfect score on what is left, the calculator tells you straight - aim a little lower, or bank more graded weight first.

Tips

- **Weights are flexible.** They do not need to total 100 - the math adjusts to whatever weights your course uses.
- **Plain average.** Set every weight to the same value (for example, 1) for a simple unweighted average.
- **Red box?** That entry is invalid. Fix it and the calculation resumes.
- **Empty rows.** An empty row pauses the calculation until it is filled or removed.
- **Reset.** Reset restores four blank rows and clears the target.

- **Private.** Nothing is uploaded or saved - everything runs in your browser.
